## IN THE CLAIMS:

1. (Currently Amended) A method for tracking tasks in a logging system, the method comprising:

receiving, at log task manager, a request associated with an application program to assign a unique task identification to a set of related events having a relationship with a task identified by the application program to be tracked, wherein the relationship between the <u>set of related</u> events and the task is established by the application program;

generating, at a log task manager, the unique task identification;
attaching the unique task identification to a transport mechanism that passes
information between components;

combining the unique task identification with logging information generated by one or more of the components to correlate logging information entries associated with related events; and

filtering a plurality of logging information entries based on the unique task identification to produce a set of correlated logging information entries associated with the related events for presentation to a user.

- 2. (Previously Presented) The method as recited in claim I, wherein attaching the unique task identification to the transport mechanism comprises attaching the unique task identification to a local thread transport.
- (Original) The method as recited in claim 2, further comprising:
   at the local thread transport, extending the inheritable thread local; and
   at the local thread transport, placing the task identification on a local thread.
- 4. (Original) The method as recited in claim 1, wherein the transport mechanism utilizes a remote proxy call.
- 5. (Original) The method as recited in claim 1, wherein the transport mechanism utilizes port hardware.

Page 2 of 8 Shah et al. - 09/895,979

- 6. (Original) The method as recited in claim 1, wherein the transport mechanism utilizes a point to point protocol.
- 7. (Original) The method as recited in claim 1, wherein the point to point protocol is a hypertext transfer protocol.
- 8. (Original) The method as recited in claim 1, wherein the transport mechanism utilizes a message context.
- 9. (Original) The method as recited in claim 1, wherein the unique task identification is a first unique task identification, the related events are first related serial events and further comprising:

receiving, at the log task manager, a request from the application program for a second unique task identification assigned to second related serial events identified by the application program; and

attaching the second unique task identification to the transport mechanism.

- 10. (Previously Presented) The method as recited in claim 1, further comprising: mapping a taskID to a corresponding action, wherein the corresponding action provides a user friendly description of the related events; and presenting logging information to a user based on the corresponding action.
- 11. (Currently Amended) A computer program product in a computer readable media for use in a data processing system for tracking tasks in a logging system, the computer program product comprising:

first instructions for receiving, at log task manager, a request associated with an application program to assign a unique task identification to a set of related events having a relationship with a task identified by the application program to be tracked, wherein the relationship between the <u>set of related</u> events and the task is established by the application program;

second instructions for generating, at a log task manager, the unique task identification;

third instructions for attaching the unique task identification to a transport mechanism that passes information between components;

fourth instructions for combining the unique task identification with logging information generated by one or more of the components to correlate logging information entries associated with related events; and

fifth instructions for filtering a plurality of logging information entries based on the unique task identification to produce a set of correlated logging information entries associated with the related events for presentation to a user.

- 12. (Previously Presented) The computer program product as recited in claim 11, wherein attaching the unique task identification to the transport mechanism comprises attaching the unique task identification to a local thread transport.
- 13. (Original) The computer program product as recited in claim 12, further comprising:

sixth instructions, at the local thread transport, for extending the inheritable thread local; and

seventh instruction, at the local thread transport, for placing the task identification on a local thread.

- 14. (Original) The computer program product as recited in claim 11, wherein the transport mechanism utilizes a remote proxy call.
- 15. (Original) The computer program product as recited in claim 11, wherein the transport mechanism utilizes port hardware.
- 16. (Original) The computer program product as recited in claim 11, wherein the transport mechanism utilizes a point to point protocol.

- 17. (Original) The computer program product as recited in claim 11, wherein the point to point protocol is a hypertext transfer protocol.
- 18. (Original) The computer program product as recited in claim 11, wherein the transport mechanism utilizes a message context.
- 19. (Original) The computer program product as recited in claim 11, wherein the unique task identification is a first unique task identification, the related events are first related serial events and further comprising:

sixth instructions for receiving, at the log task manager, a request from the application program for a second unique task identification assigned to second related serial events identified by the application program; and

seventh instructions for attaching the second unique task identification to the transport mechanism.

20. (Previously Presented) The computer program product as recited in claim 11, further comprising:

sixth instructions for mapping a taskID to a corresponding action, wherein the corresponding action provides a user friendly description of the related events; and

seventh instructions for presenting logging information to a user based on the corresponding action.

21. (Currently Amended) A system for tracking tasks in a logging system, the computer program product comprising:

a logging manager which receives request associated with an application program to assign a unique task identification to a set of related events having a relationship with a task identified by the application program to be tracked, wherein the relationship between the set of related events and the task is established by the application program;

a unique taskID generator which generates the unique task identification;

a task transport unit which attaches the unique task identification to a transport mechanism that passes information between components;

a logger which combining the unique task identification with logging information generated by one or more of the components to correlate logging information entries associated with related events; and

a filter which filters a plurality of logging information entries based on the unique task identification to produce a set of correlated logging information entries associated with the related events for presentation to a user.

22. (Previously Presented) The computer program product as recited in claim 11, further comprising:

a mapper which maps a taskID to a corresponding action, wherein the corresponding action provides a user friendly description of the related events; and

a presentation unit which presents logging information to a user based on the corresponding action.
